

# **Sensitivity Analysis For Transportation Problem**

## Changing the Objective Function Coefficient of a Nonbasic Variable

From/To	Col-1		Col-2		Col-3		Col-4		Supply &v <sub>j</sub>
Row-1		8 2	10	6	25	10		9 7	35 (0)
Row-2	45	9		12 3	5	13		7 2	50 (3)
Row-3		14 5	10	9		16 3	30	5	40 (3)
Demand &u <sub>i</sub>	45 (6)		20 (6)		30 (10)		30 (2)		

**Is this optimal solution unique?**

**All  $c_{ij}' > 0$   $Z_{\min} = 1020$  (Unique solution)**

**Question :** For what values of the cost of shipping 1 million kwh of electricity from plant-1(row-1) to city-1(col-1) will the current basis remain optimal?

**Suppose we change  $c_{11}$  from 8 to  $8 + \Delta$ .**

**For what values of  $\Delta$  will the current basis remain optimal?**

$$c'_{11} = c_{11} - u_1 - v_1 = (8 + \Delta) - 0 - 6 = 2 + \Delta$$

$$2 + \Delta \geq 0 \quad \Delta \geq -2$$

**Thus the current basis remains optimal for  $\Delta \geq -2$  and**

$$c_{11} \geq 8 + (-2) = 6$$

$$c_{11} \geq 6$$

## Changing the Objective Function Coefficient of a Basic Variable

Suppose we change  $c_{13}$  from 10 to  $10 + \Delta$ .

Then the equation  $c'_{13} = 0$  changes from  $u_1 + v_3 = 10$  to  $u_1 + v_3 = 10 + \Delta$ .

From/To	Col-1		Col-2		Col-3		Col-4		Supply & $v_j$
Row-1		8	<b>10</b>	6	<b>25</b>	$10 + \Delta$		9	<b>35</b> (0)
Row-2	45	9		12	<b>5</b>	13		7	<b>50</b> (3- $\Delta$ )
Row-3		14	<b>10</b>	9		16	<b>30</b>	5	<b>40</b> (3)
Demand & $u_i$	<b>45</b> (6+ $\Delta$ )		<b>20</b> (6)		<b>30</b> (10+ $\Delta$ )		<b>30</b> (2)		

We now price out each non-basic variable.

The current basis will remain optimal as long as each nonbasic variable has a positive (nonnegative) coefficient.

$$\begin{array}{l}
 c'_{11} = c_{11} - u_1 - v_1 = 8 - 0 - (6 + \Delta) = 2 - \Delta \geq 0 \quad \Delta \leq 2 \\
 c'_{14} = c_{14} - u_1 - v_4 = 9 - 0 - 2 = 7 \\
 c'_{22} = c_{22} - u_2 - v_2 = 3 + \Delta \geq 0 \quad \Delta \geq -3 \\
 c'_{24} = c_{24} - u_2 - v_4 = 2 + \Delta \geq 0 \quad \Delta \geq -2 \\
 c'_{31} = c_{31} - u_3 - v_1 = 5 - \Delta \geq 0 \quad \Delta \leq 5 \\
 c'_{33} = c_{33} - u_3 - v_3 = 3 - \Delta \geq 0 \quad \Delta \leq 3
 \end{array}
 \left. \vphantom{\begin{array}{l} c'_{11} \\ c'_{14} \\ c'_{22} \\ c'_{24} \\ c'_{31} \\ c'_{33} \end{array}} \right\} -2 \leq \Delta \leq 2$$

**Thus the current basis remain optimal for**

$$\mathbf{-2 \leq \Delta \leq 2,}$$

**or**

$$\mathbf{10-2 \leq c_{13} \leq 10 + 2;}$$

$$\mathbf{8 \leq c_{13} \leq 12}$$

## Increasing both supply $s_i$ and demand $d_j$ by $\Delta$

Suppose we increase  $s_1$  and  $d_2$  by 2. Since  $x_{12}$  is a basic solution, the new optimal solution will be the one in the following table.

$$\begin{aligned}\text{New Z value} &= \text{Old Z value} + \Delta u_i + \Delta v_j \\ &= 1020 + 2 u_1 + 2 v_2 \\ &= 1020 + 0 + 12 = 1032\end{aligned}$$

### New Solution

From/To	Col-1	Col-2	Col-3	Col-4	Supply & $v_j$
Row-1		$\begin{matrix} 8 \\ 2 \end{matrix}$ <b>12</b>	$\begin{matrix} 6 \\ 25 \end{matrix}$ 10	$\begin{matrix} 9 \\ 7 \end{matrix}$	$\begin{matrix} 37 \\ (0) \end{matrix}$
Row-2	<b>45</b>	$\begin{matrix} 9 \\ 12 \\ 3 \end{matrix}$	<b>5</b> 13	$\begin{matrix} 7 \\ 2 \end{matrix}$	$\begin{matrix} 50 \\ (3) \end{matrix}$
Row-3		$\begin{matrix} 14 \\ 5 \end{matrix}$ <b>10</b>	$\begin{matrix} 9 \\ 16 \\ 3 \end{matrix}$	<b>30</b> 5	$\begin{matrix} 40 \\ (3) \end{matrix}$
Demand & $u_i$	$\begin{matrix} 45 \\ (6) \end{matrix}$	$\begin{matrix} 22 \\ (6) \end{matrix}$	$\begin{matrix} 30 \\ (10) \end{matrix}$	$\begin{matrix} 30 \\ (2) \end{matrix}$	

**If  $x_{ij}$  is a nonbasic variable.**

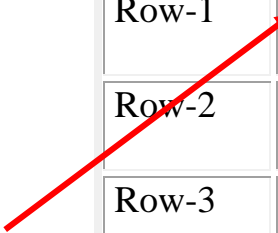

**Suppose we increase both  $s_1$  and  $d_1$  by 1.**

$x_{11}$  is a non-basic variable. Find the loop involving  $x_{ij}$  (nonbasic) and some of the basic variables. Find an odd cell in the loop that is in row  $i$ . Increase the value of this odd cell by  $\Delta$  and go around the loop, alternately increasing and then decreasing current basic variables in the loop by  $\Delta$ .

The odd cell in the loop and row 1 is  $x_{13}$ . Thus the new optimal solution will be obtained by increasing both  $x_{13}$  and  $x_{12}$  by 1 and decreasing  $x_{23}$  by 1.
